Environment

This report was prepared by the NWRM project, led by Office International de l'Eau (OIEau), in consortium with Actéon Environment (France), AMEC Foster Wheeler (United Kingdom), BEF (Baltic States), ENVECO (Sweden), IACO (Cyprus/Greece), IMDEA Water (Spain), REC (Hungary/Central & Eastern Europe), REKK inc. (Hungary), SLU (Sweden) and SRUC (UK) under contract 07.0330/2013/659147/SER/ENV.C1 for the Directorate-General for Environment of the European Commission. The information and views set out in this report represent NWRM project's views on the subject matter and do not necessarily reflect the official opinion of the Commission. The Commission does not guarantee the accuracy of the data included in this report. Neither the Commission nor any person acting on the Commission's behalf may be held Key words: Biophysical impact, runoff, water retention, effectiveness - Please consult the NWRM glossary for more information.

# IV. Design & implementation parameters

| Project scale | Medium (eg. public park, new development district)                      | 6 Natura 2000 areas |
|---------------|---|---------------------|
| Time frome    | Date of installation/construction<br>(MM.YYYY)                          | 01.2007             |
|               | Expected average lifespan (life expectancy) of the application in years |                     |

|   | Name of responsible authority/<br>stakeholder  | Role, responsibilities   |  |  |
|---|--|--|--|--|
| Responsible authority and other   | 1. Agriculture, Natural Resources<br>and Environment General<br>Direction  | Beneficiary and coordinator of the life project  |  |  |
| stakeholders involved   | 2. Natural Habitat and Agricultural Studies Department   | Partner of the project, data<br>collecting about environment<br>watching   |  |  |
|   | 3. Nature and Forest Department  | Partner of the project, forestry,<br>hunting, fishing and nature<br>conservation   |  |  |
| The application was initiated and financed by   | The application was initiated by the administration of the Wallonia<br>Region (Agriculture, Natural Resources and Environment General<br>Direction, more specifically the Natural Habitat and Agricultural<br>studies Department and Nature and Forest Department,<br>collaborating with the Natural Park of the Hautes Fagnes-Eifel<br>Management Commission).<br>The application was financed by the European Commission (Life<br>Project) and the Public Services of Wallonie.  |  |  |  |
| What were specific principles<br>that were followed in the design<br>of this application?             | The main idea was to continue the restoration of the heaths and<br>mires area in the Walloon region. It started 5 years ago (Saint<br>Hubert, Croix Saille and Tailles plateau projects). Restoration<br>methods have been developed in the region for 20 years.   |  |  |  |
|   | Number of hectares treated by the NWRM(s).   | 1400   |  |  |
| Area (ha)   | Text to specify  | The area of the rehabilitation is<br>1400 ha and is located upstream,<br>in the Ardennes mountains. The<br>application will impact a<br>downstream area. |  |  |
| Design capacity   | The project was not designed for its water retention capacity.<br>Although, about 8 km of drain were plugged and 23 ha of mires<br>were submerged. We can evaluate the volume of water in mires and<br>ponds between 120 000m <sup>3</sup> and 360 000m <sup>3</sup> depending on rain falls<br>(the water retained in soil is not counted).<br>The project design is based on experimental project in Northern<br>America and Europe. Methods implemented are a mix of Canadian<br>approach (soil restoration with replant program), European<br>approach (remoistening, flooding), heath restoration. All these<br>methods are adapted to the local conditions |  |  |  |

# VI. Socio-Economic Information

| What are the benefits and co-benefits of NWRMs in this application?   | The study of the socio-economic impact shows that the main impact is on biodiversity (assessed value $9,8M \notin /y$ ) and recreational use $(0,3M \notin /y)$ . It also shows that the impact on flood-reduction is not significant.  |             |   |  |
|---|---|-------------|---|--|
|   | Total:  | 4 500 300 € | Total amount<br>spent fort the<br>project                                     |  |
| Financial costs   | Capital:  | 2 614 178 € | Rehabilitation<br>works : Spruce<br>cut, drains<br>plugging, milling,<br>etc. |  |
|   | Land acquisition and value:   | 336 750 €   |   |  |
|   | Operational:  | 145 461 €   | Maintenance<br>works  |  |

|   | Was financial compensation required: Yes  |             |   |  |
|   | Total amount of money paid (in €): About 603 000  |             |   |  |
| Were financial compensations required?<br>What amount?  | Compensation schema: A financial compensation was given<br>to spruce plantation owners (who accepted to participation<br>to the project) for the early cut down. A estimation of the<br>value was realized based on Gembloux agronomic<br>university data. The owner received the money got from the<br>wood sail and an extra compensation (5k€ maximum per<br>person). The average compensation was 2 080€. 177ha of<br>private plantation and 113ha of public plantation were cut<br>down and compensated. |             |   |  |
|   | Comments / Remarks:   |             |   |  |
|   | Actual income loss:   |             |   |  |
| Economic costs  | Additional costs:   |             |   |  |
|   | Other opportunity costs: 29 258€/y  |             |   |  |
|   | Comments / Remarks: The opportunity costs is due to the lack of wood production   |             |   |  |
| Which link can be made to the ecosystem services approach?<br>Hint: The actual benefits of improving nature's water storage capacity are essentially linked to an improved provision of some of the following | The main ecosystem service improved by the project is<br>cosystem services approach? The main ecosystem service improved by the project is<br>amenities production (insect, birds, and specific flora)<br>also has a positive impact on landscape maintenant<br>Another service is the flood security and protect   |             |   |  |

| ecosystem goods and services:   | retention capacities of the area. |
|---|-----------------------------------|
| - Freshwater for drinking.  | 1                                 |
| - Water provision to deliver water services to<br>the economy both for drinking and non-<br>drinking purposes.  |                                   |
| - Water security (reliability of supply and resilience to drought).   |                                   |
| - Health security (control of waterborne  |                                   |
| - Eload security and protection   |                                   |
| - Storm surge protection  |                                   |
| - Biomass production.   |                                   |
| - Amenities (associated to habitat<br>protection): fish and plants, tourism,<br>recreation, and others.   |                                   |
| - Benefits of improved coastal water quality<br>and ecological status for a sustainable<br>commercial production of shellfish with<br>human health and welfare values |                                   |

# VII. <u>Monitoring & maintenance requirements</u>

|                          | The monitoring is now on :                                  |
|--------------------------|---|
|                          | - Botanic monitoring on 835m <sup>2</sup> implemented       |
|                          | by the life project team. 288m <sup>2</sup> are realized by |
|                          | the Agriculture and natural areas department.               |
|                          | $100 \text{m}^2$ will be added for the meadow               |
|                          | monitoring  |
|                          | Odonates monitoring at 45 points                            |
|                          | Pinde are gite size thread 0 listening a size               |
|                          | - birds monitoring through 9 listening points.              |
|                          | It comes in addition with water birds                       |
|                          | observation during the two migration periods                |
| Monitoring requirements  | - Black grouse monitoring : realized by the                 |
|                          | Walloon administration with Liege University                |
|                          | - Lepidopterous insects monitoring : The only               |
|                          | species to be monitored is the Boloria                      |
|                          | aquilonaris   |
|                          | - An impact assessment on hydrological works                |
|                          | is running  |
|                          | All the monitoring are realized or framed by                |
|                          | the Agriculture and natural environment                     |
|                          | department and the Nature and Forest                        |
|                          | Department  |
|                          | A concernation plan "After life" was designed               |
|                          | A conservation plan Alter life was designed.                |
|                          | It defines all the maintenance tasks (mowing                |
|                          | and grazing, maintenance of hydraulic                       |
| Maintenance requirements | structures, etc). The Agriculture and natural               |
| maintenance requirements | environment department and the Nature and                   |
|                          | Forest Department, Walloon administration,                  |
|                          | the natural park of the hautes fagnes, the                  |
|                          | friends of the fagnes association, the                      |

|                                    | Patrimoine Nature, enterprises, farmers, communes and private owner are involved in the maintenance. |
|------------------------------------|--|
| What are the administrative costs? |  |

### VIII. Performance metrics and assessment criteria

| Which assessment methods and practices are used for assessing the biophysical impacts?         | An impact assessment on hydrological works<br>is running. The biodiversity is measured<br>through the monitoring (described above)                           |
|--|--|
| Which methods are used to assess costs, benefits and cost-effectiveness of measures?           | The project did not assess costs, benefits or<br>cost-effectiveness of the measure. The<br>European Union realized an economic<br>assessment of the project. |
| How cost-effective are NWRM's compared to "traditional / structural" measures?                 | No cost-effectiveness assessment was realized.   |
| How do (if applicable) specific basin characteristics influence the effectiveness of measures? | Peaty soils are generally steep in the "Hautes<br>Fagnes" region. Methods and technologies<br>were adapted.  |
| What is the standard time delay for measuring the effects of the measures?                     |  |

### IX. <u>Main risks, implications, enabling factors and preconditions</u>

| What were the main implementation barriers?      | For private and municipal areas, the adherence<br>to the restoration project and to have their<br>plot restored.<br>The period to realize works was very short<br>(July to October). The short period of works<br>required many enterprises available at the<br>same moment.<br>Half of the area of the site project is a national<br>nature reserve including Natura 2000 areas<br>(some deteriorated). It was an element in favor<br>of the implementation of the project. It led to<br>ambitious objectives (wide area). There also<br>were areas under national property (but not<br>included in natural reserve) was also favorable.<br>Indeed, Walloon administration was the head<br>project and wanted to realize a deep<br>restoration |  |
|--|---|--|
| What were the main enabling and success factors? |   |  |
| Financing  | The project was financed 50% by the European commission and 50% by the Wallonia administration.   |  |
| Flexibility & Adaptability                       |   |  |
| Transferability                                  | There are still wide areas of heaths and mire<br>that could be restored in the Walloon region.  |  |

# X. <u>Lessons learned</u>

| Key lessons | Even if forestry activities were removed, there are still economic<br>benefits linked to biodiversity and recreational use. |
